Notes: The table reports the interaction coefficients from a difference in differences regression model. We control for time fixed effects, age, marital status, number of people in the household, child presence, household income, and other housing indicators (number of rooms, having sewage, hot water, refrigerator, internet and other alike). Standard errors are clustered at the semester level. The unit of observation is the individual-semester. Our baseline sample is individuals between 16 and 45 years old.
